### 3 Software Guide

#### (1) Required Software Requirements

Application software **ITE\_TCon\_DemoAP\_v2.0.exe** required.

#### (2) E Ink APPLICATION Display mode Introduction

#### ● What is a Waveform?

A predefined sequence of voltages applied to the E Ink material to switch it from one gray tone to another gray tone.

Paired to display by production lot, display size, and waveform type.

Standard waveforms ensure proper product performance and reliability.

#### ● The waveform contains the following WF modes:

##### ➤ MODE 0 — INIT

Initialize is used to completely clear the display, if it's left in an unknown state (i.e. if the previous image has been lost by a re-boot)

##### ➤ MODE 1 — DU

Direct update Non-flashing waveform that can be used to update. It can update any changed gray tone pixel to black or white only. This waveform can be used for pen or other fast menu updates. It only updates changed pixels.

##### ➤ MODE 2 — GC16

Grayscale Clear, 16 Levels. A “flashy” waveform used for 16 level grayscale images. This provides the best image appearance. All the pixels are updated or cleared.

➤ **MODE 3 — GL16**

The GL16 waveform is used to update anti-aliased text with reduced flash. GL16 should be used only with Full Display Update, the entire display except pixels staying in white will update as the new image is written. The GL16 waveform has 16 unique gray levels.
